

Glycol Ethers for Latex Adhesives

Latex adhesives are used in binding various substrates together, for example, paper to paper and polyethylene to paper. They are also used in joint cements, sealants, caulks, and mastics.

DOWANOL* PPh, Butyl CARBITOL™ and DALPAD A glycol ethers function as latex coalescing agents and also as tackifiers in adhesive formulations. In addition to their strong solvency for the latex, these glycol ethers all exhibit low odor, are compatible in water systems and have an evaporation rate slower than that of water.
