Subject: test at 100°C on IGUs

With reference to your email request of September 25th, 2019, we have received from you n.3 insulating glass units you have declared have been assembled with the following butyl:

butyl DS335 Special Black

All three IGUs were tested for two weeks at a constant temperature of 100°C.

Below is a representative photo of the visual conditions of the butyl at the end of the two weeks of testing. This test don't check the performance of an IGU.

Remaining available for any clarifications, we send best regards
