Imagine boosting manufacturing productivity for reliable seals and gasketing

Silicone foams selection guide
Why choose Dow Performance Silicones?

Dow Performance Silicones has been a global leader in silicone-based technology for more than 70 years. Headquartered in Michigan, USA, we maintain manufacturing sites, sales and customer service offices, and research and development labs in every major geographic market worldwide to ensure you receive fast, reliable support for your processing and application development needs.

Unique product technology

To describe Dow Performance Silicones is to describe the history and evolution of silicone technology, which generated a legacy of innovative and reliable products under the Dow Corning label for more than seven decades. Today that legacy continues under the DOWSIL™ brand name, which encompasses more than 7,000 proven silicone products and services. Few companies offer a conformal coatings portfolio with comparable breadth and proven performance, and none match our history in silicone technology.

Dow's two-part, dispensable silicone foams offer a cost-effective alternative to preformed gaskets and foam tapes for applications in automotive, aviation, consumer and industrial devices, electronics, lighting, medical devices, and telecommunications.

Within these markets and others, Dow’s high-performing silicone foams deliver outstanding benefits in applications such as:

- Environmental seals
- Dust and vapor seals
- Heat shields
- Vibration insulation
- EMI/RFI shielding
- Outdoor electrical gaskets
- Chip package and battery cushions
- High-intensity discharge lighting seals
- Timing belt covers and door modules
- Gas boiler gaskets

Benefits of silicone foams from Dow

- Low compression set of dispensed seals translates into high serviceability
- Low modulus and force deflection behavior of cured foam seals delivers more flexible joint design
- Durable protection against harsh conditions, including wide operation temperatures, chemicals, UV, dust and moisture
- The ability to form in place, allowing fast and accurate processing, increased throughput, and the elimination of costly automated or manual placement processes
- A sustainable solution that minimizes waste during processing and requires no external blowing agents
- Compatibility with a broad range of two-component mixing and dispensing platforms
Why silicone foams from Dow stand out

As global competition increases, manufacturers face greater demands for products that deliver long-lasting durability, greener solutions and lower costs.

Performance features of silicone foams from Dow
DOWSIL™ and SILASTIC™ silicone foams offer reliable, cost-effective options to manufacturers who seek foamed-in-place gaskets that dispense and cure directly on parts. These integrated compression gaskets deliver long-lasting, flexible seals for a competitive edge.

Dow’s portfolio of dispensed foams encompasses both room temperature and addition cure mechanisms that, with the application of heat, can deliver accelerated cure for faster cycle times and improved productivity. Dow’s selection further offers a variety of flow rates and densities, providing greater control over foaming height relative to flat or inclined surfaces. They have a generally low compression set that enables them to recover their original shape after being compressed. Like other silicone-based elastomers, silicone foams maintain their resiliency over a broad temperature range.

More efficient manufacturing
Typically dispensed directly on part surfaces with a robotic applicator, Dow’s two-part silicone foams are designed for efficiency in processing. (See Figure 1.)

Figure 1. Robotic application of silicone foams speeds production and minimizes waste. These two-component silicone materials can be mixed either in static or dynamic mixers, though dynamic mixers are recommended to help ensure optimal density, cure and cell structure of the finished foam. Mixing produces a reaction that releases hydrogen gas as a foaming agent. The gasket expands in its liquid stage and cures to form a low-modulus, integrated compression seal. Seals are ready for handling as quickly as 10 minutes after application and can support full assembly within an hour at room temperature.
Dow offers you a range of silicone foam products, helping you find one that meets your application needs and helps reduce suppliers and costs. This product line includes a range of foam densities as well as flowable, reduced-flow and thixotropic foams, giving you greater control over foaming height relative to flat or inclined surfaces.
