Paints, Inks and Coatings

Produce More-Sustainable Coatings Without Sacrificing Performance

Paint formulators are under pressure to deliver more-sustainable coatings. This is reflected in the demand for lower-temperature, and hence lower-energy, curing systems. This is especially relevant to formulators who produce high temperature resistant coatings, which usually require high curing temperatures.

Traditional solutions have been methyl methoxy resins, but these suffer from stress due to their high crosslink density after curing, which limits flexibility and film build.

With DOWSIL™ 2405 Resin, formulators have an option to significantly extend the formulating space for room-temperature-curing, high-temperature and corrosion resistant coatings.

DOWSIL™ 2405 Resin for High Temperature and Weather Resistant, Ambient Cure Coatings

Improve Coating Flexibility and Impact Resistance

Room Temperature Cure

When catalyzed with appropriate hydrolysis and/or condensation catalysts, DOWSIL™ 2405 Resin is tack free in < 15 min and cures within 60 minutes at ambient conditions (20°C) to form a medium-hard and solvent-resistant coating. Depending on film thickness, desired cure profile, and performance requirements, 0.5-3%wt (on resin solids) of catalyst is required.

Some traditional phenyl-methyl resins physically dry to provide high hardness (Figure 1). However, they have low solvent resistance and do not exhibit good (full) cure until heat-cured. In contrast, methyl methoxy resins, such as DOWSIL™ US-CF-2403 Resin and DOWSIL™ 2405 Resin, exhibit complete cure at ambient conditions and provide medium to high hardness and excellent solvent resistance.

Features of DOWSIL™ 2405 Resin

- Room temperature curing without tin catalyst
- High heat resistance (650°C with black or aluminum pigments)
- Improved flexibility and impact resistance
- Excellent gloss and color retention
- Hydrophobic
- Solventless delivery
- Low smoke generation on initial heating
- Compatible with other silicone resins
- Can be used as a primer and/or topcoat

**Improved Flexibility/Impact Resistance**

For selected substrates and where film thickness can be controlled, formulators can create very fast-curing systems using methyl methoxy resins such as DOWSIL™ US-CF-2403 Resin. However, the high crosslink density can result in films that are brittle and have poor impact resistance.

With DOWSIL™ 2405 Resin, the flexibility and impact resistance are significantly improved (Figure 2).

All samples contain 1% TnBT and 10% aluminum flake. 10 = excellent; 1 = failure (cracked/shattered)

**Excellent Weatherability**

Clear and colored coatings were exposed to 1,500 hours of UVB radiation; gloss retention > 90% and color change (ΔE) < 2, which is visually undetectable by the average human eye, were observed.

DOWSIL™ 2405 Resin is hydrophobic and provides good water beading. Clear coatings had a water contact angle of > 95° and pigmented coatings showed higher water contact angles > 112°.

The hydrophobicity and crosslink density of DOWSIL™ 2405 Resin enable utility in corrosion resistant coatings, when formulated with appropriate fillers and pigments, such as leafing aluminum. Application data available upon request.

**Solventless Delivery with Good Build/Viscosity**

The low molecular weight of methyl methoxy resins can lead to difficulties when formulating easy-to-spray products with good build per coat. However, with the slight increase in molecular weight of DOWSIL™ 2405 Resin, formulators have more formulation options to achieve good build with less risk of sagging. In addition, DOWSIL™ 2405 Resin is delivered solventless!

**More Than Heat Resistance**

Our innovative, silicon-based technologies can help you infuse your products with high-value performance attributes that can give you a competitive advantage in the marketplace. As a leader and innovator with a long history of success in the industry, Dow’s performance-enhancing coating technology platforms are well-aligned to the needs of the increasingly competitive global coatings market.
