

DOWSIL™ 9510 Petroleum Antifoam

Novel technology for foam control in crude oil

The evolution of oil production and oil-gas separation units requires distinct and unique additives. In addition to reducing foam and liquid carry-over problems, antifoams for three-phase separators need to be robust across systems with low cost and minimal impact on downstream operations.

The new foam control technology developed by Dow for use in crude oil uses innovative organo-modified polysiloxane actives and also replaces the traditional organic solvent with water.

The new product, DOWSIL™ 9510 Petroleum Antifoam, shows similar or better results compared to conventional solvent-based additives, like DOWSIL™ 9945 and DOWSIL™ 9902. It can be applied in several types of crude oil, from low to high API grades, at the same use levels as the conventional technology (20 – 100 ppm).

Figure 1 shows the initial foam volume in samples of crude API 26° without additive, crudes containing 20 ppm of the traditional technology (PDMS in solvent), and DOWSIL™ 9510. These lab evaluations were done with compressed aging cells in a roller oven.

DOWSIL™ 9510 Petroleum Antifoam also reduces the concerns about silicon carry-over in the oil, based on results of Atomic Absorption Spectrometry with different types of crude treated with 50 ppm of antifoam and then demulsified. As it is water-based, the siloxane actives have a different partition coefficient compared to the traditional technology, reducing the residual silicon in the oil (**Figure 2**). In addition, it has no impact on the Total Oil and Greases content (TOG) in the residual separation water, according to the standard industry evaluation protocols (**Figure 3**).

To switch from the conventional solvent-based materials to the new water-based technology, no engineering modifications in the existing production facilities are required. The new product has low viscosity (50 cSt) and microbiological and physical-chemical stabilities longer than six months.

By replacing hydrocarbons with water, DOWSIL™ 9510 Petroleum Antifoam reduces the carbon footprint in the petrochemical industry, as well risks related to environment, health and safety.
