SILASTIC™ RBL-9694-30P Liquid Silicone Rubber

Two-part silicone elastomer for integrated compression seals

Features & Benefits
- Two-part addition cure silicone elastomer
- Hardness suitable for sealing applications under medium clamping loads
- Non-sag nature yields accurate, uniform gasket beads of precise dimensions as defined by robot application parameters
- User-friendly, easy to handle 1:1 mix ratio
- Fast cure at elevated temperatures, no post-curing
- Low compression set
- Good adhesion to many substrates
- Long term stability over a wide temperature range (-50°C to 200°C)
- Does not require solvents, CFCs or other environmentally harmful materials for processing

Applications
- SILASTIC™ RBL-9694-30P Liquid Silicone Rubber is designed to be dispensed and cured directly on automotive and other industrial components to form integrated gaskets.
- Typical applications include gaskets for components which require medium clamping forces, e.g. intake systems, front covers and throttle valves.

Typical Properties
Specification Writers: These values are not intended for use in preparing specifications.

Description

SILASTIC™ RBL-9694-30P Liquid Silicone Rubber is a two-part heat-cure silicone elastomer, designed to be easily mixed and dispensed via meter-mix equipment. It is cured directly on automotive and other industrial components to form an integrated, high strength compression seal. It is resistant to many industrial fluids (e.g. engine oils, water/glycol mixtures) over a broad temperature range with the exception of fuels and non-polar solvents.

The Cured-in-Place-Gasket Concept (CIPG)

The 'Cured-in-Place-Gasket' concept made possible with SILASTIC™ RBL-9694-30P Liquid Silicone Rubber provides a successful alternative to traditional gasketing methods using manually installed preformed rubber gaskets. This approach provides greater design flexibility as the robotically applied liquid silicone beads can easily follow complex surface geometries. Additionally, changes in part design can be rapidly accommodated by reprogramming the dispensing system. The extruding seals are applied and positioned with excellent reproducibility time after time, ensuring good sealing performance. Equally important, the sealing/curing process lends itself ideally to a continuous, fully automated operation thus providing meaningful savings on the costs associated with manual gasket installation.

How to Use

Substrate Preparation

SILASTIC™ RBL-9694-30P Liquid Silicone Rubber adheres to many metallic and plastic substrates (normally without using primer). This feature ensures the cured gaskets will not be displaced during packaging or handling of the sealed component. Regardless of the substrate, the sealing surfaces should be clean and free of dirt, oils, and release agents to ensure good adhesion. In most instances washing with water based industrial detergents will remove these contaminants. Some substrates however will require additional treatment to achieve good adhesion. This could mean plasma, corona, flame treatment or chemical priming.

How to Use (Cont.)

Processing
SILASTIC™ RBL-9694-30P Liquid Silicone Rubber is optimally mixed, dispensed and applied to the components to be sealed using a fully automated and integrated process.

Metering/Mixing
The mixing step is successfully carried out with commercially available two component meter-mix pumps designed to work on a 1:1 weight ratio. The A and B components are pumped from pails or drums using follower-plate mounted piston pumps, then fed into smaller, precise gear or piston pumps where the actual metering takes place. The precisely metered A and B components are then mixed by means of standard multi-element static mixers. The working time of the A/B mixture at room temperature is about 4–6 hours and this eliminates the danger of blocking the mixer with cured product during normal production stops.

Application
For automated bead application the mixing head is attached to a robotic arm or alternatively the wrist applicator of an XYZ table gantry. Typically the meter-mix equipment and the robot or XYZ table are fully integrated in a system which dispenses precisely metered volumes of uncured elastomer in a preprogrammed path onto the component to be sealed. The desired bead dimensions are achieved by a combination of parameters involving the pump throughput rate, the dispensing head diameter and tip speed, and the distance from tip to component surface.

The non-sag nature of SILASTIC™ RBL-9694-30P Liquid Silicone Rubber ensures that the dispensed bead dimensions remain unchanged after the bead is cured. The gasket bead size is a function of the sealing gap and the flange width.

Curing
Curing and adhesion of SILASTIC™ RBL-9694-30P Liquid Silicone Rubber gasket beads are achieved by submitting the uncured elastomer to a temperature of 150°C for 6–8 minutes. In an automated process the components to be sealed will typically be mounted on a conveyor system and the bead applied by robot with a typical cycle time of 10 to 45 seconds per component (depending on size). The gasket beads are then cured by passing the sealed components through a heating tunnel.

The required cure time of 6–8 minutes is obtained by appropriate dimensioning of the tunnel length for a given conveyor speed. A particularly efficient way to transfer heat to the elastomer for effective curing, and to minimize heat dissipation in the mass of the component, is the use of focused infrared heating elements.

Handling Precautions
PRODUCT SAFETY INFORMATION REQUIRED FOR SAFE USE IS NOT INCLUDED IN THIS DOCUMENT. BEFORE HANDLING, READ PRODUCT AND SAFETY DATA SHEETS AND CONTAINER LABELS FOR SAFE USE, PHYSICAL AND HEALTH HAZARD INFORMATION. THE SAFETY DATA SHEET IS AVAILABLE ON THE DOW WEBSITE AT DOW.COM, OR FROM YOUR DOW SALES APPLICATION ENGINEER, OR DISTRIBUTOR, OR BY CALLING DOW CUSTOMER SERVICE.

Usable Life and Storage
Product should be stored at or below 35°C (95°F) in original, unopened containers.
**Limitations**

This product is neither tested nor represented as suitable for medical or pharmaceutical uses.

**Health and Environmental Information**

To support customers in their product safety needs, Dow has an extensive Product Stewardship organization and a team of product safety and regulatory compliance specialists available in each area.

For further information, please see our website, dow.com or consult your local Dow representative.

**Disposal Considerations**

Dispose in accordance with all local, state (provincial) and federal regulations. Empty containers may contain hazardous residues. This material and its container must be disposed in a safe and legal manner.

It is the user’s responsibility to verify that treatment and disposal procedures comply with local, state (provincial) and federal regulations. Contact your Dow Technical Representative for more information.

**Product Stewardship**

Dow has a fundamental concern for all who make, distribute, and use its products, and for the environment in which we live. This concern is the basis for our product stewardship philosophy by which we assess the safety, health, and environmental information on our products and then take appropriate steps to protect employee and public health and our environment. The success of our product stewardship program rests with each and every individual involved with Dow products - from the initial concept and research, to manufacture, use, sale, disposal, and recycle of each product.

**Customer Notice**

Dow strongly encourages its customers to review both their manufacturing processes and their applications of Dow products from the standpoint of human health and environmental quality to ensure that Dow products are not used in ways for which they are not intended or tested. Dow personnel are available to answer your questions and to provide reasonable technical support. Dow product literature, including safety data sheets, should be consulted prior to use of Dow products. Current safety data sheets are available from Dow.
