Selection Guide

## Solutions for Industrial, Appliance and Maintenance

### DOWSIL™ Silicone Sealants

Silicon-based sealants from Dow last longer and are more versatile than most organic polymer sealants. They are durable RTV sealants; cure at room temperature to a tough, rubbery solid with exceptional performance characteristics; and meet a wide variety of your industrial bonding and sealing needs.

Benefits of DOWSIL™ silicone sealants include:

#### Stability Over a Wide Temperature Range

When properly cured, most of our products can be used at temperatures ranging from -56 to 177°C (204°C intermittent), with still others capable of higher thermal stability up to and exceeding 260°C (315°C intermittent).

#### Weather Resistance

High resistance to ultraviolet (UV) rays, radiation and weather prevents our products from hardening, cracking, crumbling, drying and becoming brittle.

#### Chemical Stability

Our sealants do not readily degrade, even under long-term exposure to many chemicals and atmospheric pollutants.

#### Good Bond Strength

Our products provide good adhesion to a wide variety of industrial materials, including glass, ceramics and wood masonry; painted surfaces; and many metals and plastics.

#### Electrical Properties

Designed for a variety of applications, our products can be used in various electrical and electronic applications, including devices that are thermally cycled over a wide temperature range.

#### Low Flammability

In fire conditions, silicone adhesives/sealants are reluctant to burn. Many products comply with UL flammability standards.

When you specify an assembly and maintenance product from Dow, you receive a solution backed by the world leader in silicone technology with more than 70 years of expertise and innovations.

## Why Silicones?

For application versatility, durability, aesthetics and value, silicones outperform organics. Silicone sealants from Dow are unrivaled, delivering:

- Protection that typically lasts three times longer than organic materials in the same applications, thus avoiding premature and costly renovations
- Proven performance with successful track records in a range of diverse applications
- Outstanding life-cycle value
- All-weather application and performance, with resistance to UV exposure, ozone, rain, snow and extreme temperatures
- More durability than organic-based materials
- Continued flexibility and adhesion, even while being stretched or compressed
- Resistance to cracking, splits or tears without hardening or fading
- Easy application over a wide temperature range

Organics are prone to chemical reversion, a phenomenon in which organic polyurethane loses its cured properties and reverts to a substance with the softness of chewing gum. The differences between silicones and organics are the difference between long-term value and premature failure. Silicones prevail.

## Which Silicone?

Silicone sealants from Dow are offered in a wide range of formulation options, including:

- **RTV (room-temperature-vulcanizing) sealants**

These silicone polymers work with a condensation reaction in humidity at typical room conditions, but the cure can be accelerated by increasing temperature and humidity. RTV sealants are easy to install, and they offer relatively low cost and good adhesion.

- **Heat cure sealants**

Delivering much shorter cure times than RTV sealants, these materials can be automatically dispensed to meet industrial equipment assembly requirements.

- **Hot-melt silicone sealants**

Ideal for automated applications in the manufacturing of various components, these reactive hot-melt materials provide instant green strength, which can increase productivity, improve quality and reduce costs in industrial assembly applications.

- **One-part materials**

Containing all the ingredients needed to produce a cured material, these sealants use external factors – such as moisture in the air, heat or the presence of UV light – to initiate, speed or complete the curing process. One-part sealant formulations are easy to use and typically have a low- or room-temperature cure, but moisture-curing materials may take 24 hours or more to fully cure.

- **Two-part materials**

With the reactive ingredients separated to prevent premature initiation of the cure process, these materials often use the addition of heat to facilitate or accelerate cure. Two-part formulations typically offer longer shelf life, high-speed cure, and the ability to carefully control working/

open time and cure time by manipulating the formulation, but they require mixing and may involve more sophisticated processes and application expertise.

- **Silicone foams**

Ideal as compression gaskets or as “environmental seals” to protect against ambient air, splashed water, dust and moisture, these materials are a cost-effective sealing solution compared to preformed gaskets and foam tapes for use sealing high-tolerance gaps. Applied using automated robotic dispensing, these materials have a fast room-temperature or low-temperature cure.

## Sealant Chemistry

Silicone sealants typically consist of an inorganic siloxane (Si-O-Si-O-Si) polymer and appropriate filler, crosslinker, catalyst, adhesion promoter, pigment and plasticizer.

To meet specific needs, silicone sealants are offered in a variety of chemistries and cure types, each with their own benefits. The following tables will assist you in selecting the right material to help meet your performance requirements.

**Table I: Sealant Chemistries**

Chemistry	Surface Cure	Green Strength	Primerless Adhesion	Shelf Life	Clear/ Translucent	Features	Limitations
<b>Acid Cure</b>							
Acetoxy (One-Part)	•••	•	•	•••	••	<ul style="list-style-type: none"> <li>• Competitively priced versus organics</li> <li>• Fast cure</li> <li>• No-catalyst versions available</li> <li>• Good shelf life</li> <li>• Clear</li> <li>• Adhesion durability</li> </ul>	<ul style="list-style-type: none"> <li>• Acidic; potentially corrosive to metals</li> <li>• Strong odor</li> </ul>
<b>Neutral Cure</b>							
Alkoxy (One-Part)	•	•	••	••	LA <sup>1</sup>	<ul style="list-style-type: none"> <li>• Neutral cure</li> <li>• Robust adhesion</li> <li>• Economical; chalk filled</li> <li>• Low VOC</li> </ul>	<ul style="list-style-type: none"> <li>• Stability of silica system not robust, so achieving clarity is difficult</li> <li>• Slower cure speed</li> <li>• 12-month shelf life</li> </ul>
Oxime (One-Part)	••	••	•	•	••	<ul style="list-style-type: none"> <li>• Fast cure</li> <li>• Low-catalyst options possible</li> <li>• Good silica versions with clear/translucent offerings</li> </ul>	<ul style="list-style-type: none"> <li>• High-temperature (40°C) storage causes discoloration</li> <li>• Strong odor</li> <li>• High VOC, typically due to large leaving group</li> </ul>
Alkoxy (Two-Part)	••	•••	•	•	NA	<ul style="list-style-type: none"> <li>• Fast cure/green strength; parts can be moved in under 4 hours</li> <li>• Total VOC low when mixed</li> <li>• Tunable cure profile based on mix ratio</li> <li>• Adhesion to many substrates</li> </ul>	<ul style="list-style-type: none"> <li>• Dispensing equipment and maintenance</li> <li>• Settling of components can be an issue</li> <li>• Catalyst is flammable</li> </ul>
Hot Melt (One-Part)	••	•••	•••	••	•••	<ul style="list-style-type: none"> <li>• Instant green strength for immediate hold</li> <li>• Instant assembly – no “hold time” requirement</li> <li>• Worker friendly – low odor, nonhazardous</li> <li>• Long pot life and long open time</li> <li>• Proven neutral-cure 100% silicone chemistry</li> <li>• Aggressive adhesion to a variety of substrates</li> </ul>	<ul style="list-style-type: none"> <li>• Not intended for use when in total confinement (atmospheric moisture required for cure)</li> <li>• Not intended for continuous water immersion</li> <li>• Not intended for use on surfaces that might bleed oils, plasticizers or solvents</li> </ul>
Platinum (Two-Part) “Silicone Foams”	•	–	–	•	NA	<ul style="list-style-type: none"> <li>• Fast-curing products available in heat cure and room temperature cure options</li> <li>• Ideal choice for compression gaskets</li> <li>• Provides environmental sealing versus elements</li> <li>• Low sealing force/modulus</li> <li>• Ideal for sealing enclosures requiring serviceability</li> <li>• Allows for flexibility in seal and bead design</li> </ul>	<ul style="list-style-type: none"> <li>• Not optimized for fluid sealing</li> <li>• Does not offer high adhesion without a primer or surface treatment</li> <li>• Cure inhibition (“poisoning” of platinum catalyst)</li> </ul>

NA = Not available; LA = Limited availability; – = Poor; • = Good; •• = Better; ••• = Best

Hot-melt, neutral-cure sealants are intended for assembly, bonding, sealing, gasketing and other OEM applications that require instant adhesion and high green strength.

These sealants feature:

- Excellent adhesion to most substrates without the need for a primer

- Instant adhesion, enabling parts to be shipped out quickly
- Long open time
- Long pot life
- Low VOC
- Safe handling with nonhazardous composition and by-products
- Long life once cured

Two-part, addition-cure silicone foams are designed to be dispensed and cured directly on parts to form an integrated compression gasket. They typically are used in automotive parts, including seals for vibration and noise damping, housings for electronic devices, exterior lighting, and domestic appliance components.

These sealants feature:

- Room temperature cure (RTV)
- 1:1 mix ratio
- CFC-free content
- Low post-cure compression set
- Stability and flexibility across a wide range of temperatures

### Surface Preparation

Although DOWSIL™ silicone sealants possess excellent bond strength, maximum adhesion is only attained on surfaces that are clean and dry. Contaminants – such as dirt, grease, water, tar or rust – act as release agents and prevent the formation of durable bonds. Use of a primer does not negate the necessity for proper surface cleaning.

Wet or dirty surfaces should be properly prepared before sealants are applied.

- Wipe contaminated surface with a clean, oil-free cloth.
- Rewipe surface with a suitable cleaner or industrial solvent, such as isopropyl alcohol (IPA), mineral spirits, naphtha or ketones. Note: Do not clean surface with detergent or soap. (Soap residue may act as release agent.)
- Rough rubber surfaces with sandpaper. Make a spot-check to determine the adhesion of sealants for each application. Bond strength will increase as the sealant cures.

The active ingredients must thoroughly wet-out and coat the bonding surfaces. Mild abrasion, solvent cleaning, plasma, corona discharge and other pretreatments have been used to clean and enhance surface reactivity to bonding. In general, light surface abrasion is recommended whenever possible, because it promotes good cleaning and increases the surface area for bonding. Clean and/or degrease surfaces with DOWSIL™ OS Fluids, naphtha, mineral spirits, methyl ethyl ketone (MEK), or other suitable solvents that will remove oils and other contaminants that may be present. A final surface wipe with acetone or IPA also may be helpful.

Some cleaning techniques may give better results than others; determine the best technique for your application. For especially difficult-to-bond-to surfaces, it may be necessary to increase the surface reactivity by using chemical etchants or oxidizers or by exposing the surface to UV, corona, plasma or flame sources. Allow solvents to completely evaporate before applying the primer.

**Table VII. Cleaners and Primers**

Cleaners				
	DOWSIL™ DS-1000 Aqueous Silicone Cleaner	DOWSIL™ DS-2025 Silicone Cleaning Solvent	DOWSIL™ R41 Cleaner Plus	
Special Features	Cleaner for use on uncured silicone; effectively emulsifies silicone oils, greases and uncured elastomers; effective degreaser on a wide range of applications; aqueous solution; complies with EU detergent regulation on biodegradability of surfactants; nonflammable	Cleaner for use on cured silicone; rapid digestion of cured silicone; leaves silicone-free surface; nonflammable; high flash point; does not contain aromatic solvent; nonhalogenated solvent; low viscosity; multiple use and recyclable	Specially formulated solvent containing a special DOWSIL™ catalyst substance designed to clean and additionally prepare a large variety of substrates for the bonding with DOWSIL™ sealants	
Applications	Cleaning surfaces, equipment and manufacturing units contaminated with nonsubstantive uncured silicone residues	Cleaning surfaces, equipment and manufacturing units contaminated with substantive cured silicone residues	Cleaning and preparation of the most common surfaces such as glass, metal profiles, plastics and other non porous substrates	
Primers				
	DOWSIL™ PR-1200 RTV Prime Coat	DOWSIL™ 1200 OS Primer Clear	DOWSIL™ 1203 3in 1 Primer	DOWSIL™ PR-2260 Prime Coat
Special Features	Significantly improves the adhesion of silicone sealants to a wide variety of challenging substrates; available in clear and red	Useful for both moisture-curing-RTV and heat-curing silicones; diluted in low-molecular-weight silicone fluid; meets many international regulations for low VOC content (including European Union); similar to DOWSIL™ P5200 Adhesion Promoter	Cleaning and priming with only one material; traceability through UV lamp; optimizes adhesion of sealant to surface; more rapid development of adhesion to surface	Dilute solution of silane coupling agents and other active ingredients
Applications	Improves the adhesion of silicone sealants, coatings and rubber to masonry, wood, granite, metals, glass, ceramics, plastics, rubbers and coatings	Enhances bonding/adhesion of RTV and heat-cure silicones to ceramics, glass, wood, masonry, structural plastics (including FR-4) and many metals	UV-traceable cleaner and primer for silicone adhesives and sealants	Enhances bonding/adhesion of RTV and heat-cure silicones to many metals, ceramics and some plastics

### Primers and Adhesion Promoters

For maximum adhesion, DOWSIL™ primer is recommended. After solvent-cleaning, apply a thin coat of DOWSIL™ primer in a very light, even coat by wiping, dipping or spraying. Wipe off excess material to avoid overapplication, which generally appears as a white, chalky surface. When dip- or spray-coating, diluting by a factor of 2 to 4 with additional solvent may avoid excessive buildup.

### Primer Cure

At normal room temperatures and 50% relative humidity conditions, allow the primer to air-dry from five to 30 minutes. Low-humidity and/or low-temperature conditions require longer cure times. Mild heat acceleration of the cure rate may be possible, but temperatures above 60°C are not recommended. During application, the carrier solvent typically evaporates quickly, allowing the active ingredients to begin to react with atmospheric moisture and bonding surfaces. For optimal bonding, different cure times may be required for different temperature and humidity conditions; determine the best cure schedule and conditions for your application. Apply the desired silicone sealant after the primer, prime coat or adhesion promoter has fully cured.

## Sealant Application

Apply DOWSIL™ brand adhesives/sealants to one of the prepared surfaces, then quickly cover with the other substrate to be bonded. On exposure to moisture, the freshly applied material will “skin over” in about 5 to 10 minutes (depending on the product) at room temperature and 50% relative humidity.

Tool the sealant to coat or wet the substrate surface for maximum bonding. This typically is done by properly filling the joint first and then dry-tooling the sealant by pressing and pulling a round-tipped spatula or similar tool across the sealant surface. This step forces sealant into joint surfaces and helps remove air pockets or voids at the bond line. Tooling should be completed before the skin forms.

Keeping the primed surface clean may allow application of the silicone elastomer to be delayed – but in some cases, if too much time elapses, lower adhesion can result. Users are encouraged to determine the optimal cure conditions for their specific applications and the effects of any hold times imposed between applications of the primer and sealant. In some cases, it may be recommended to reprime surfaces if 8 to 24 hours elapse before the silicone sealant can be applied.

## Cure Time

After skin formation, cure continues inward from the surface. In 24 hours (at room temperature and 50% relative humidity), DOWSIL™ adhesive/sealant will cure to a depth of about 1/8". Very deep sections, especially when access to atmospheric moisture is restricted, will take longer to cure completely. Cure time is extended at lower humidity levels.

Because the sealants cure by reaction with moisture in the air, keep the container tightly sealed when not in use. A plug of used material may form in the tip of a tube or cartridge during storage. This is easily removed and does not affect the remaining contents.

## Compatibility

Some DOWSIL™ adhesives/sealants release a small amount of acetic acid during cure. This may cause corrosion on some metallic parts or substrates, especially in direct contact or when the cure is carried out in a totally enclosed environment that does not allow cure by-products to escape.

Platinum catalysts used in addition-cure silicone sealants – including silicone foams – are sensitive to contamination by certain compounds that have the power to stop or inhibit cure. For more information, refer to “Guarding against potential inhibitors/poisons of platinum-catalyzed addition-cure release coatings,” Form No. 30-1053-01, available in the Technical Library on [consumer.dow.com](http://consumer.dow.com) or upon request from Dow customer service.

## Cleanup/Sealant Removal

Cured silicone can be removed from a surface with a sharp blade if the cured silicone material is accessible. If it is difficult to cut through, solvents – such as IPA, toluene, xylene, naphtha or mineral spirits – may be used to soften the cured sealant. DOWSIL™ OS Fluids also can be used to help soften cured silicone and/or remove silicone residue after it has been removed mechanically from a surface. DOWSIL™ OS Fluids will generally be a lower-VOC alternative to standard solvents.

## Limitations

Refer to individual product data sheets for use limitations.

## Health and Environmental Information

To support customers in their product safety needs, Dow has an extensive Product Stewardship organization and a team of Product Safety and Regulatory Compliance (PS&RC) specialists available in each area.

For more information, please see our website, [consumer.dow.com](http://consumer.dow.com), or consult your local Dow representative.

## Contact Us

For more than 60 years, OEM designers, maintenance and materials engineers around the world have trusted Dow for performance and expertise to solve or prevent sealant challenges. Dow has sales offices, manufacturing sites, and science and technology laboratories – and a network of more than 3,000 distributors – around the world.

To learn more about our extensive product and service offerings, order samples, or find a local distributor, visit [consumer.dow.com](http://consumer.dow.com).

### HANDLING PRECAUTIONS

PRODUCT SAFETY INFORMATION REQUIRED FOR SAFE USE IS NOT INCLUDED IN THIS DOCUMENT. BEFORE HANDLING, READ PRODUCT AND SAFETY DATA SHEETS AND CONTAINER LABELS FOR SAFE USE, PHYSICAL AND HEALTH HAZARD INFORMATION. THE SAFETY DATA SHEET IS AVAILABLE ON THE DOW WEBSITE AT [WWW.CONSUMER.DOW.COM](http://WWW.CONSUMER.DOW.COM), OR FROM YOUR DOW SALES APPLICATION ENGINEER, OR DISTRIBUTOR, OR BY CALLING DOW CUSTOMER SERVICE.

### LIMITED WARRANTY INFORMATION – PLEASE READ CAREFULLY

The information contained herein is offered in good faith and is believed to be accurate. However, because conditions and methods of use of our products are beyond our control, this information should not be used in substitution for customer's tests to ensure that our products are safe, effective and fully satisfactory for the intended end use. Suggestions of use shall not be taken as inducements to infringe any patent.

Dow's sole warranty is that our products will meet the sales specifications in effect at the time of shipment.

Your exclusive remedy for breach of such warranty is limited to refund of purchase price or replacement of any product shown to be other than as warranted.
